

Python Practice Questions

1. Given a string name, e.g. "Amy", return a greeting of the form "Hello Amy!".
2. Given two integer values, return their sum. Unless the two values are the same, then return double their sum; use functions.
3. Given a string and a non-negative integer n, we'll say that the front of the string is the first 3 chars, or whatever is there if the string is less than length 3. Return n copies of the front ;use functions.
4. Plan your trip: Define City, Cost, days in separate functions and return the total cost for the trip.
5. Given a string s return the number of times that the string "code" appears anywhere in the given string; use functions.
6. Given a non-empty string like "Code" return a string like 'CCodeoCodedCodee'.
7. Given a list of integer, return True if 6 appears as either the first or last element in the array. The array will be length 1 or more.
8. Given 2 lists of integer, a and b, return True if they have the same first element or they have the same last element.
9. Given a list of ints, return the sum of the first 2 elements in the array. If the array length is less than 2, just sum up the elements that exist, returning 0 if the array is length 0.
10. Given the following dictionary:

```
inventory = {  
'gold' : 500,  
'pouch' : ['flint', 'twine', 'gemstone'],  
'backpack' : ['xylophone', 'dagger', 'bedroll', 'bread loaf']  
}
```

 - Add a key to inventory called 'pocket'.
 - Set the value of 'pocket' to be a list consisting of the strings 'seashell', 'strange berry', and 'lint'.
 - .sort()the items in the list stored under the 'backpack' key.
 - Then .remove('dagger') from the list of items stored under the 'backpack' key.
 - Add 50 to the number stored under the 'gold' key.
11. WAP to display all natural numbers up to 100 which are not divisible by 5
12. Define a function that computes the length of a given list or string without using len().
13. The web is built with HTML strings like "<i>Yay</i>" which draws Yay as italic text. In this example, the "i" tag makes <i> and </i> which surround the word "Yay". Given tag and word strings, create the HTML string with tags around the word, e.g. "<i>Yay</i>".
 - make_tags('i', 'Yay') → '<i>Yay</i>'
 - make_tags('i', 'Hello') → '<i>Hello</i>'

14. Given a string, return the string made of its first two chars, so the String "Hello" yields "He". If the string is shorter than length 2, return whatever there is, so "X" yields "X", and the empty string "" yields the empty string "".

15. Given 2 strings, return their concatenation, except omit the first char of each. The strings will be at least length 1.

- `non_start('Hello', 'There') → 'ellohere'`
- `non_start('java', 'code') → 'avaode'`

16. Given a string, return a string where for every char in the original, there are two chars.

- `double_char('The') → 'TThhee'`
- `double_char('AAbb') → 'AAAAbbbb'`
- `double_char('Hi-There') → 'HHii--TThheerree'`

17. Return the number of times that the string "hi" appears anywhere in the given string.

- `count_hi('abc hi ho') → 1`
- `count_hi('ABChi hi') → 2`
- `count_hi('hihi') → 2`

18. Given two strings, return True if either of the strings appears at the very end of the other string, ignoring upper/lower case differences (in other words, the computation should not be "case sensitive"). Note: `s.lower()` returns the lowercase version of a string.

- `end_other('Hiabc', 'abc') → True`
- `end_other('AbC', 'HiaBc') → True`
- `end_other('abc', 'abXabc') → True`

19. Given 3 int values, a b c, return their sum. However, if one of the values is 13 then it does not count towards the sum and values to its right do not count. So for example, if b is 13, then both b and c do not count.

- `lucky_sum(1, 2, 3) → 6`
- `lucky_sum(1, 2, 13) → 3`
- `lucky_sum(1, 13, 3) → 1`

20. Given three ints, a b c, return True if one of b or c is "close" (differing from a by at most 1), while the other is "far", differing from both other values by 2 or more. Note: `abs(num)` computes the absolute value of a number.

- `close_far(1, 2, 10) → True`
- `close_far(1, 2, 3) → False`
- `close_far(4, 1, 3) → True`

21. Given 2 ints, a and b, return their sum. However, sums in the range 10..19 inclusive, are forbidden, so in that case just return 20.

- `sorta_sum(3, 4) → 7`
- `sorta_sum(9, 4) → 20`

- `sorta_sum(10, 11) → 21`

22. Given a day of the week encoded as 0=Sun, 1=Mon, 2=Tue, ...6=Sat, and a boolean indicating if we are on vacation, return a string of the form "7:00" indicating when the alarm clock should ring. Weekdays, the alarm should be "7:00" and on the weekend it should be "10:00". Unless we are on vacation -- then on weekdays it should be "10:00" and weekends it should be "off".

- `alarm_clock(1, False) → '7:00'`
- `alarm_clock(5, False) → '7:00'`
- `alarm_clock(0, False) → '10:00'`

23. Given a number n, return True if n is in the range 1..10, inclusive. Unless "outsideMode" is True, in which case return True if the number is less or equal to 1, or greater or equal to 10.

- `in1to10(5, False) → True`
- `in1to10(11, False) → False`
- `in1to10(11, True) → True`

24. Given a list of integers, return the difference between the largest and smallest values in the list.

25. Given a list of Fruits, remove the 3rd and the 5th element from the list.

26. WAP that takes a list and returns a new list that contains all the elements of the first list minus all the duplicates. Use functions.

27. Define a function `histogram()` that takes a list of integers and prints a histogram to the screen. For example, `histogram([4, 9, 7])` should print the following:

```
****
*****
*****
```

28. Create a new dictionary called `prices` using `{}` format like the example above.

- Put these values in your `prices` dictionary:

```
"banana": 4,
"apple": 2,
"orange": 1.5,
"pear": 3
```

- Loop through each key in `prices`. For each key, print out the key along with its price and stock information. Print the answer in the following format:

```
apple
price: 2
stock: 0
```

- Let's determine how much money you would make if you sold all of your food.
- Create a variable called `total` and set it to zero.
- Loop through the `prices` dictionaries. For each key in `prices`, multiply the number in `prices` by the number in `stock`. Print that value into the console and then add it to `total`.
- Finally, outside your loop, print `total`.

29. First, make a list called `groceries` with the values "banana", "orange", and "apple".

- Define this two dictionaries:

```
stock = {
"banana": 6,
"apple": 0,
```

```
"orange": 32,  
"pear": 15  
}
```

```
prices = { "banana": 4,  
"apple": 2,  
"orange": 1.5,  
"pear": 3  
}
```

- Define a function `compute_bill` that takes one argument `food` as input. In the function, create a variable `total` with an initial value of zero. For each item in the food list, add the price of that item to `total`. Finally, return the total. Ignore whether or not the item you're billing for is in stock. Note that your function should work for any food list.
- Make the following changes to your `compute_bill` function:
- While you loop through each item of food, only add the price of the item to `total` if the item's stock count is greater than zero.
- If the item is in stock and after you add the price to the total, subtract one from the item's stock count.

30. Represent a small bilingual lexicon as a Python dictionary in the following fashion `{"merry": "god", "christmas": "jul", "and": "och", "happy": "gott", "new": "nytt", "year": "år"}` and use it to translate your Christmas cards from English into Swedish. That is, write a function `translate()` that takes a list of English words and returns a list of Swedish words.

31. Given 2 strings, `a` and `b`, return a string of the form `short+long+short`, with the shorter string on the outside and the longer string on the inside. The strings will not be the same length, but they may be empty (length 0).

- `combo_string('Hello', 'hi') → 'hiHellohi'`
- `combo_string('hi', 'Hello') → 'hiHellohi'`
- `combo_string('aaa', 'b') → 'baaab'`

32. Given a string, return a "rotated left 2" version where the first 2 chars are moved to the end. The string length will be at least 2.

- `left2('Hello') → 'lloHe'`
- `left2('java') → 'vaja'`
- `left2('Hi') → 'Hi'`

33. Return True if the string "cat" and "dog" appear the same number of times in the given string.

- `cat_dog('catdog') → True`
- `cat_dog('catcat') → False`
- `cat_dog('1cat1cadodog') → True`

34. The number 6 is a truly great number. Given two int values, `a` and `b`, return True if either one is 6. Or if their sum or difference is 6. Note: the function `abs(num)` computes the absolute value of a number. ; Use exception Handling to validate input

- `love6(6, 4) → True`
- `love6(4, 5) → False`
- `love6(1, 5) → True`

35. Define a function `generate_n_chars()` that takes an integer `n` and a character `c` and returns a string, `n` characters long, consisting only of `c`'s. For example, `generate_n_chars(5,"x")` should return the string

"xxxxx". (Python is unusual in that you can actually write an expression `5 * "x"` that will evaluate to "xxxxx". For the sake of the exercise you should ignore that the problem can be solved in this manner.)
